## DSC 80 Discussion 2 Worksheet

## 1 WI24 Midterm Problem 3

Jasmine is a veterinarian. Below, you'll find information about some of the dogs in her care, separated by district and breed.

|  | Beagle | Cocker Spaniel |  |  |
| :--- | ---: | ---: | ---: | ---: |
|  | Mean Weight | Count | Mean Weight | Count |
| District 1 | 25 | 3 | 20 | 2 |
| District 2 | 45 | 1 | $x$ | $y$ |

What is the mean weight of all beagles in the table above, across both districts?

Notice that the table above has two unknowns, $x$ and $y$. Find positive integers $x$ and $y$ such that the mean weight of all beagles is equal to the mean weight of all cocker spaniels, where $x$ is as small as possible.

## 2 FA23 Midterm Problem 1

|  | date | name | food | weight |
| ---: | ---: | ---: | ---: | ---: |
| $\mathbf{0}$ | $2023-01-01$ | Sam | Ribeye | 0.20 |
| $\mathbf{1}$ | $2023-01-01$ | Sam | Pinto beans | 0.10 |
| 2 | $2023-01-01$ | Lauren | Mung beans | 0.25 |
| 3 | $2023-01-02$ | Lauren | Lima beans | 0.30 |
| 4 | $2023-01-02$ | Sam | Sirloin | 0.30 |

Find the total kg of food eaten for each day and each person in df as a Series.
df.groupby ( $\qquad$ ) [ $\qquad$ ]. sum ()

Find all the unique people who did not eat any food containing the word "beans".

```
def foo(x):
    return
        ----------------------------------
```

df.groupby (
$\qquad$ ). $\qquad$ (foo)['name'].unique()

## 3 FA23 Final Problem 1

The bus table (left) records bus arrivals over 11 day for all the bus stops within a 22 mile radius of UCSD.

|  | time | line | stop | late | time | Time of arrival (str). Note that the |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 12pm | 201 | Gilman Dr \& Mandeville Ln | -1.1 |  | 12 pm vs. $1: 15 \mathrm{pm}$ ). |
| 1 | 1:15pm | 30 | Gilman Dr \& Mandeville Ln | 2.8 | line | Bus line (int). There are multiple buses per bus line each day. |
| 2 | 11:02am | 101 | Gilman Dr \& Myers Dr | -0.8 | stop <br> late | Bus stop (str). <br> The number of minutes the bus |
| 3 | 8:04am | 202 | Gilman Dr \& Myers Dr | NaN |  | rived after its scheduled time. Nega- |
| 4 | 9 am | 30 | Gilman Dr \& Myers Dr | -3.0 |  | early (float). Some entries in this column are missing. |

The stop table (left) contains information for all the bus lines in San Diego (not just the ones near UCSD).

|  | line | stop | next |  | Bus line (int). |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 201 | Gilman Dr \& Mandeville Ln | VA Hospital | next | The next bus stop for a par- |
| 1 | 201 | VA Hospital | La Jolla Village Dr \& Lebon Dr |  | ticular bus line (str). For example, the first row of the |
| 2 | 30 | VA Hospital | Villa La Jolla Dr \& Holiday Ct |  | table shows that after the |
| 3 | 30 | UTC | NaN |  | 201 stops at Gilman Dr \& Mandeville Ln, it will stop at the VA Hospital next. A missing value represents the end of a line. |

Compute the number of buses in bus whose next stop is 'UTC'.
x = stop.merge( $\qquad$ , on $=$ $\qquad$ , how = $\qquad$ )
x [_] . shape [0]

Compute the number of unique pairs of bus stops that are exactly two stops away from each other. For example, if you only use the first four rows of the stop table, then your code should evaluate to the number 2, since you can go from 'Gilman Dr \& Mandeville Ln' to 'La Jolla Village Dr \& Lebon Dr' and from 'Gilman Dr \& Mandeville Ln' to 'Villa La Jolla Dr \& Holiday Ct' in two stops. Hint: The suffixes $=(1,2)$ argument to merge appends a 1 to column labels in the left table and a 2 to column labels in the right table whenever the merged tables share column labels.

```
m =
```

$\qquad$

``` .merge(
``` \(\qquad\)
``` , left_on =
``` \(\qquad\)
``` , right_on =
``` \(\qquad\)
``` _,
```

$\qquad$

``` ].drop_duplicates ().shape [0])
```

```
            how =
```

            how =
            __-_-_-_-_--_,
            __-_-_-_-_--_,
                suffixes=(1, 2))
                suffixes=(1, 2))
    (m[

```
(m[
```

## 4 FA22 Midterm Problem 7

|  | category | completed | minutes | urgency | client |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $\mathbf{0}$ | work | False | NaN | 2.0 | NaN |  |
| $\mathbf{1}$ | work | False | NaN | 1.0 | NaN |  |
| $\mathbf{2}$ | work | True | 13.5 | 2.0 | NaN |  |
| $\mathbf{3}$ | work | False | NaN | 1.0 | NaN |  |
| $\mathbf{4}$ | relationship | True | 5.3 | NaN | NaN |  |
| $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $\mathbf{9 8 3 1}$ | consulting | True | 71.7 | 2.0 | San Diego Financial Analysts |  |
| $\mathbf{9 8 3 2}$ | finance | True | 36.4 | 1.0 | NaN |  |
| $\mathbf{9 8 3 3}$ | work | True | 31.1 | 1.0 | NaN |  |
| $\mathbf{9 8 3 4}$ | work | True | 24.8 | 3.0 | NaN |  |
| $\mathbf{9 8 3 5}$ | work | False | NaN | 2.0 | NaN |  |

The code below creates a pivot table.

```
pt = tasks.pivot_table(index='urgency', columns='category', values='completed', aggfunc='sum')
```

Which of the below snippets of code will produce the same result as pt.loc [3.0, 'consulting']? Select all that apply.

Snippet 1:
tasks[(tasks['category'] == 'consulting') \& (tasks['urgency'] == 3.0)]['completed'].sum()
Snippet 2:

```
tasks[tasks['urgency'] == 3].groupby('category')['completed'].sum().loc['consulting']
```

Snippet 3:
tasks.groupby('urgency') ['completed'].sum().loc[3.0, 'consulting']
Snippet 4:
tasks.groupby(['urgency', 'category'])['completed'].sum().loc[(3.0, 'consulting')]
$\square$ Snippet 5
tasks.groupby('completed').sum().loc[(3.0, 'consulting')]
